## Simulation Setup

This simulation is performed with  $n = 200$  and  $d = 10$ , using the 2-d lattice as the underlying graph.  $s = 2$  parameters are set to be nonzero, and the beta parameter is chosen to be  $\beta = 0$ . The attached results are for a 10-replication simulation. The true values of the parameter vector  $\theta$  are

0 0 0 0 0 0 0.7071068 0 0.7071068 0 ,

but for brevity, our simulation only estimates the indices of  $\theta$  in  $\mathcal{C} = \{7, 9, 1, 4\}$  elements of  $\theta$ . Accordingly, **all statistics and visuals are indicative of performance only on the set  $\mathcal{C}$ .**

The results from our code are compared to those of Cai, Guo, and Ma (2021).

The attached results include the mean-squared error for each parameter estimate, as well as boxplots for a selection of nonzero and zero-valued parameters. In the boxplots, the green line represents the true value of the estimated parameter.

After these, I show coverage statistics for 95% symmetric confidence intervals for each of the parameters.
